

SAFARI

(sub-Saharan AFrican Associations and Related Identities)

The SAFARI dataset contains pairs of identity terms and associated stereotype attributes. Each pair is further annotated to indicate the offensiveness and prevalence of the stereotype using a Likert scale. This dataset has been created through community engagement in Ghana, Kenya, Nigeria and South Africa, to aid evaluations of models for stereotypes with nuanced coverage of the axes of disparities, and unique identities prevalent in India, as well as prevention of imposition of Western gaze. The dataset's English subset includes 3,534 stereotypes. Additionally, its multilingual subset contributes 3,206 stereotypes collectively spanning 15 African languages (Dagbani, Twi, Ga, Ewe, Kiswahili, Luhya - Isukha, Kikuyu, Kalenjin - Kipsigis, Igbo, Hausa, Yoruba, Xhosa, Afrikaans, Zulu, and Sotho).

Size of dataset

Number of instances **3534**

Number of fields **15**

Field 1. Unique Identifier

Reference ID for each respondent (e.g., "GH0001")

Field 2. Participant Ethnicity

Tribe and Language (e.g., "Xhosa - IsiXhosa")

Field 3. Language of the Interview

Language in which the interview was conducted

Field 4. Stereotype sentence in English

Stereotype sentence as mentioned by the participant, captured in English

Field 5. Stereotype Identity Term

Stereotype identity term identified in the stereotype sentence

Field 6. Stereotype Attribute

Stereotype attribute identified in the stereotype sentence

Field 7. Stereotype Identity Axis

Identity axis associated with the identity term (e.g., ethnicity, gender, etc)

This dataset provides a collection of stereotype sentences (for example, "Igbos from Nigeria are hardworking"). For each sentence, it identifies the identity term and the stereotype attribute in both English and the respondent's native language.

Furthermore, the dataset includes ratings for the perceived offensiveness and prevalence of each stereotype, measured on a Likert scale. It also offers optional fields for capturing local slang or other relevant contextual information.

	Field 8. Slang or local language-specific term Optional field to capture any slang or local term Field 9. Meaning of the slang term Optional field to capture meaning of the slang term Field 10. Offensiveness of the stereotype Perceived offensiveness of the stereotype on a scale of 1 to 5 (1 = Not offensive; 5 = Extremely Offensive) Field 11. Prevalence of the stereotype Perceived prevalence of the stereotype on a scale of 1 to 4 (1 = Rarely used; 4 = Extremely common) Field 12. Additional comments and context Optional field to capture any additional context Field 13. Native language of the participant Native language of the participant Field 14. Stereotype Identity Term (in native language) Post hoc translation of the stereotype identity term to the participant's native language Field 15. Stereotype Attribute (in native language) Post hoc translation of the stereotype attribute to the participant's native language

SENSITIVE HUMAN ATTRIBUTES	SOURCE(S) OF HUMAN ATTRIBUTES	RATIONALE FOR COLLECTING HUMAN ATTRIBUTES
Race Gender Ethnicity Socio-economic status Geography Language Sexual Orientation Religion Age Culture Disability Experience or Seniority Others (please specify)	[Human Attribute]: Source [Geography]: the stereotypes are related to demonyms or the region of the world a person belongs to. [Culture]: Annotators were asked to label whether the attribute token of the tuple is commonly believed to be Stereotypically associated to the identity term of the tuple. This annotation inherently and intentionally captures the view of the society or the culture.	We collect stereotypes associated to a person's geographical belonging, which is also inherently related to their culture. This helps create a benchmark with a broad coverage so systems and models deployed across the globe can be more rigorously evaluated.

The dataset was not used for any applications. No training or fine-tuning of systems was performed. The data was only used for diagnostic analysis of existing models and not used to create any new systems		

Terms of Art

Concepts and Definitions referenced in this Data Card

Identity Term

Definition: These are words used to describe a group of people with a common trait or identity. In the context of this data we identify identity terms along region, specifically demonyms.

For eg: Nigerians is a term used to describe the people of Nigeria, Ashantis is a term used to describe people who belong to the Ashanti tribe of Ghana.

Attribute Term

Definition: These are characteristics or attributes for which we aim to identify stereotypical associations. These span categories like profession, adjectives, socio-economic status, subjects of study and so on.

For eg: doctor, teacher (profession), poor, powerful (socio-economic status), smart, handsome, ugly (adjectives), computer science, mathematics (subjects of study) and so on.

Tuple

Definition: A combination of one identity term and one attribute token.

For eg: (South Africans, Friendly); (Igbos, Hardworking) etc.

Stereotype/Stereotypical

Definition: In social psychology, a stereotype is a generalized belief about a particular category of people. It is an expectation that people might have about every person of a particular group.
